1.	Answer all five units by choosing one question from each unit ( $5 \times 14 = 70$ Marks)
	*****
、	
a)	Define pole pitch, front pitch, back pitch, resultant pitch, commutator pitch and illustrate them with the help of neat sketches?
b)	Why most practical energy conversion devices use magnetic field as the coupling medium
	between electrical and mechanical systems?
a)	<b>OR</b> Explain why equalizer connections are used in lap windings and dummy coils are sometimes
u)	used in wave winding?
b)	Elucidate the principle of energy conversion of electromechanical system?
	UNIT–II
a)	Derive an equation for EMF in a DC machine.
b)	An 8-pole DC generator has per pole flux of 40 Wb and winding is connected in lap with 960
	conductors. Calculate the generated emf on open circuit when it runs at 400 rpm. If the armature is wave wound at what speed must the machine be driven to generate the same voltage.
	OR
a)	Discuss the armature reaction in dc machines.
a) b)	Explain the different types of dc generators and mention their applications.
0)	
	What is the experimental procedure to obtain the load characteristics of dc shunt generator?
	Explain.
	OR
a)	Draw OCC of a dc shunt generator and define critical speed and critical resistance
b)	A dc shunt generator has the following open circuit magnetization curve at its rated speed.
	Field current (A)         0.5         1.0         1.5         2         3         4
	EMF (V)         180         340         450         500         570
	The resistance of the field circuit is 200 . The generator is driven at its rated speed. Find
	the terminal voltage on open circuit. (Use graph paper)
a)	Explain the working principle of DC motor.
b)	What are the factors effecting the speed of dc motors?
	OR
a)	Sketch the torque vs current characteristics of dc shunt and dc series motor with relevant
	torque equation?
b)	List the applications of dc shunt, dc series and dc compound motors
	UNIT-V
a)	Describe the back to back test in detail with advantages and disadvantages?
b)	In a brake test on a dc shunt motor, the effective load on the pulley was 13kg, the effective
	diameter of the pulley was 46cm, the speed 1400rpm, the armature current 23A, when the
	supply voltage is 220V.Calculate the efficiency of the motor at this load when field resistance is 110 ohms.
	OR
	A 50KW, 440V Shunt generator having an armature circuit resistance including inter-pole
	winding of 0.15 ohms at normal working temperature was run as a shunt motor on no-load at

current of 1.5A. Calculate the efficiency of the shunt generator at 3/4th of full-load
