		(Mechanical Engineering)	<u></u>		
	M	ax. Marks: 70 Answer all five units by choosing one question from each unit (5 x 14 = 70 M	e: 3 Hc Iarks)	ours	
		******			Blooms
		UNIT–I	Marks	со	Level
1.		Derive the general heat conduction equation in cylindrical coordinate system.			
		Simplify the obtained equation to one dimensional conduction equation.	14M	1	3
		OR			
2.	,	What is thermal diffusivity? Explain its importance in heat conduction problems.	6M	1	2
	b)	Explain the boundary and initial conditions?	8M	1	2
3.	a)	UNIT-II Derive the temperature distribution equation and heat transfer rate equation in a			
0.	u)	plane wall.	8M	2	3
	b)	A wall of 0.5m thickness is to be constructed from a material which has an			
		average thermal conductivity of 1.4 W/mK. The wall is to be insulated with a material having an average thermal conductivity of 0.35 W/mK so that the heat			
		loss per square meter will not exceed 1450W. Assuming that the inner and outer			
		surface temperatures are 1200°C and 15°C respectively, Calculate the thickness		_	_
		of insulation required.	6M	2	3
Л	2)	OR Classify the Fine Define Effectiveness and efficiency of Fin	6M	2	2
4.	a) b)	Classify the Fins. Define Effectiveness and efficiency of Fin. A motor body is 360 mm in diameter (outside) and 240 mm long. Its surface	OIVI	Z	2
	0)	temperature should not exceed 55°C when dissipating 340W. Longitudinal fins of			
		15 mm thickness and 40 mm height are proposed. The convection coefficient is			
		40W/m2K. Determine the number of fins required. Atmospheric temperature is 30° C. K = 40 W/m K. Assume no heat loss from the tip of the Fin.	8M	2	3
			om	-	Ũ
5.	a)	Find the relation between Nuselt, Prandtl and Grashof number using			
		dimensional analysis in Natural convection.	7M	3	3
	b)	A vertical pipe of 20cm outer diamer at surface temperature of 100°C in a room where the air is 20°C. The pipe is 3m long. What is the rate of heat loss per			
		meter length of pipe?	7M	3	3
		OR			
6.	a)	Compare the variation of velocity, temperature and local heat transfer coefficient			
		along a vertical plate for the pate under natural convection and forced convection	6M	3	2
	b)	A 30 cm long glass plate is hung vertically in the air at 27 °C while its	om	Ũ	-
	,	temperature is maintained at 77 °C. Calculate the boundary layer thickness at			
		the trailing edge of the plate. If a similar plate is place in a wind tunnel and air is blown over it at a velocity of 4 m/s , estimate the boundary layer thickness at its			
		blown over it at a velocity of 4 m/s, estimate the boundary layer thickness at its trailing edge?	8M	3	3
			Page		

		Cod	de: 5G	555	
		UNIT–IV			
7.	a)	Distinguish between filmwise and dropwise condensation .	6M	4	2
	b)	Dry saturated steam at a pressure of 2.45 bar condenses on the surface of a vertical tube of height 1 m. The tube surface temperature is kept at 117 °C . Estimate the thickness of the condensate film and the local heat transfer coefficient at a distance of 0.2 m from the upper end of the tube.	8M	4	3
		OR			
8.	a)	a) Define the following:			
		i) Irradiation, Emissivity and radiation shape factor.	7M	4	1
	b)	b) Two parallel black plates $0.5m \times 1.0m$ are separated by $0.5m$ distance. One plate is at $1100^{\circ}C$ and the other at $600^{\circ}C$. Compute the net radiant heat			
		exchange between the two plates.	7M	4	3
•	、		014	_	0
9.	a)	Classify heat exchangers and list various applications of it.	6M	5	2
	b)	A refrigerator is designed to cool 250 kg/h of hot liquid of specific heat 3350 J/kg K at 120° C using a parallel flow arrangement . 1000 kg/h of cooling water is available for cooling purpose at a temperature of 10°C. If the overall heat transfer coefficient is 1160 W/m ² K and the surface area of heat exchanger is 0.25m ² , calculate the outlet temperature of the coolest liquid and water and also			
		the effectiveness of the heat exchanger.	8M	5	3
		OR			
10.	a)	Derive the expression for LMTD for parallel flow heat exchangers.	8M	5	3
	b)	Hot oil with a capacity rate of 2500 W/K flows through a double pipe heat exchanger. It enters at 360 °C and leaves at 300 °C. Cold fluid enters at 30 °C and leaves at 200 °C. If the overall heat transfer coefficient is 800 W/m2K, determine the heat exchanger area required for i) parallel flow and ii) Counter			
		flow.	6M	5	3

L6

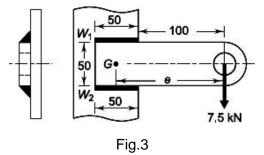

L6

OR

- 6. a) What are the advantages and disadvantages of welded joints? 4M co3 L1, L2
 - b) A welded connection, as shown in Fig.3 is subjected to an eccentric force of 7.5 kN. Determine the size of the welds if the permissible shear stress for the weld is 100 N/mm². Assume static conditions.

- 7. a) What is a knuckle joint? Give practical examples of knuckle joint.
 b) Design the rectangular key for a shaft of 50 mm diameter. The shearing and
 - crushing stresses for the key material are 42 MPa and 70 MPa. 10M CO4

OR

Design and draw a cotter joint to support a load varying from 30 kN in Compression to 30 kN in tension. The material used is carbon steel for which the following allowable stresses may be used. The load is applied statically. Tensile stress = compressive stress = 50 MPa; shear stress = 35 MPa and crushing stress= 90 MPa.

UNIT–V

- 9. a) What are the different criteria of designing a shaft?
 b) Find the diameter of a solid shaft to transmit 25 kW at 300 rpm. Take the maximum allowable shear stress as 50 N/mm². If a hollow shaft is to be used in place of the solid shaft, find the inside and outside diameter when the ratio of inside to outside diameter is 0.6.
 4M CO5 L1,L2
 4M CO5 L1,L2
 - OR
- Design a cast iron protective flange coupling to connect two shafts in order to transmit 7.5 kW at 720 r.p.m. The following permissible stresses may be used: Permissible shear stress for shaft, bolt and key material = 33 MPa; Permissible crushing stress for bolt and key material = 60 MPa; Permissible shear stress for the cast iron = 15 MPa

CO5
